

# SIMATS ENGINEERING

## ASSESSMENT TOOL 3

**COURSE CODE: CSA1407**

**COURSE NAME: Compiler Design**

---

### **COURSE OUTCOME COVERED**

***CO4:** Examine intermediate code generation techniques to enhance code optimization (BL4)*

*Assessment Tool Weightage: 10%*

---

**QUESTIONS:**

**Total Marks:50**

Annexure A

### **DATA INTERPRETATION**

---

#### ***Code of Conduct:***

*I M.VINAY(192311146)(Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment.*

*I understand that any violation of academic integrity rules will result in disciplinary action.*

M.VINAY

***Signature of the student:***

Annexure A

## DATA INTERPRETATION

### Q1. Intermediate Code Analysis and Optimization

Given the three-address code:

```
t1 = x + y
t2 = t1 * z
t3 = t2 / w
t4 = t3 - p
```

Analyze the sequence of operations and construct the equivalent expression tree. Evaluate how temporary variables improve intermediate code generation and reduce repeated computations.

---

### Q2. Symbol Table and Memory Allocation

Given the following symbol table entries:

**Variable Data Type Size (Bytes)**

|   |        |   |
|---|--------|---|
| p | char   | 1 |
| q | double | 8 |
| r | int    | 4 |
| s | float  | 4 |

Interpret how the compiler allocates memory for these variables and calculate the total memory required. Analyze how alignment and data types affect memory organization.

---

### Q3. Optimization in Intermediate Code

Given the intermediate code:

```
t1 = m * n
t2 = p + q
t3 = m * n
t4 = t2 - t3
```

Trace the execution step-by-step and identify optimization opportunities such as common subexpression elimination and redundant computation removal. Explain how optimization improves execution efficiency.

---

### Q4. Control Flow and Boolean Expression Handling

Given the Boolean expression:

```
if (x > y || p < q)
```

Intermediate code:

```
if x > y goto L1
if p < q goto L1
goto L2
L1: ...
```

Interpret the control flow of the given intermediate representation and explain how short-circuit evaluation minimizes unnecessary condition checking during execution.

---

### Q5. Backpatching and Flow Control

Given:

| Instruction | Target |
|-------------|--------|
|-------------|--------|

|                     |  |
|---------------------|--|
| 200: if x==y goto _ |  |
|---------------------|--|

| Instruction | Target |
|-------------|--------|
|-------------|--------|

|             |  |
|-------------|--|
| 201: goto _ |  |
|-------------|--|

Backpatch lists:

- truelist = {200}
- falselist = {201}

Analyze the role of backpatching in intermediate code generation. Demonstrate how target addresses are updated during control flow handling and explain its importance in Boolean expression translation.

ANSWERS:

**Q1. Intermediate Code Analysis and Optimization**

Given:

$t1 = x + y$

$t2 = t1 * z$

$t3 = t2 / w$

$t4 = t3 - p$

### 1. Sequence of operations

The operations are performed in the following order:

1.  $t1 = x + y$
2.  $t2 = t1 * z$
3.  $t3 = t2 / w$
4.  $t4 = t3 - p$

Therefore, the equivalent expression is:

$((x + y) * z / w) - p$

### 2. Equivalent Expression Tree

### 3. Role of Temporary Variables

Temporary variables such as  $t1$ ,  $t2$ ,  $t3$ , and  $t4$  store intermediate results.

For example:

$t1 = x + y$

stores  $x + y$ , which can then be used directly in the next operation.

Advantages:

- Breaks complex expressions into simple operations.
- Makes code generation easier for the compiler.
- Provides explicit intermediate results.
- Avoids recalculating already computed expressions.
- Makes optimization easier.
- Helps map high-level expressions to machine instructions.

Thus, temporary variables improve the **clarity, efficiency, and manageability** of intermediate code.

---

## Q2. Symbol Table and Memory Allocation

Given:

| Variable | Data Type | Size |
|----------|-----------|------|
|----------|-----------|------|

|     |      |        |
|-----|------|--------|
| $p$ | char | 1 byte |
|-----|------|--------|

|     |        |         |
|-----|--------|---------|
| $q$ | double | 8 bytes |
|-----|--------|---------|

|     |     |         |
|-----|-----|---------|
| $r$ | int | 4 bytes |
|-----|-----|---------|

|     |       |         |
|-----|-------|---------|
| $s$ | float | 4 bytes |
|-----|-------|---------|

### 1. Memory Allocation

Assuming variables are allocated sequentially without considering padding:

$p \rightarrow 1$  byte

$q \rightarrow 8$  bytes

$r \rightarrow 4$  bytes

$s \rightarrow 4$  bytes

Total:

$$\begin{aligned}\text{Total} &= 1 + 8 + 4 + 4 \\ &= 17 \text{ bytes}\end{aligned}$$

Therefore, the minimum memory required is **17 bytes**.

## 2. Effect of Alignment

Modern processors generally require certain data types to start at suitable memory addresses.

For example:

- char  $\rightarrow$  usually 1-byte alignment
- int  $\rightarrow$  usually 4-byte alignment
- float  $\rightarrow$  usually 4-byte alignment
- double  $\rightarrow$  commonly 8-byte alignment

If p starts at address 1000:

$p \rightarrow 1000$  (1 byte)

Padding  $\rightarrow 1001\text{--}1007$

$q \rightarrow 1008\text{--}1015$  (8 bytes)

$r \rightarrow 1016\text{--}1019$  (4 bytes)

$s \rightarrow 1020\text{--}1023$  (4 bytes)

In this example, **7 bytes of padding** are introduced before q.

So the total allocated memory can become:

$$17 + 7 = 24 \text{ bytes}$$

## 3. Effect of Data Types

Different data types require different amounts of memory because they represent different ranges and precision.

For example:

- char requires less memory.
- int is used for integer values.
- float provides single-precision floating-point storage.
- double provides greater precision and generally requires more memory.

Therefore, **data types determine storage requirements, while alignment can introduce padding and increase the actual memory allocated.**

---

## Q3. Optimization in Intermediate Code

Given:

$$t1 = m * n$$

$$t2 = p + q$$

$$t3 = m * n$$

$$t4 = t2 - t3$$

### 1. Step-by-Step Execution

**Step 1:**

$$t1 = m * n$$

The product of m and n is calculated and stored in t1.

**Step 2:**

$$t2 = p + q$$

The sum of p and q is calculated and stored in t2.

**Step 3:**

$t3 = m * n$

The same expression  $m * n$  is calculated again.

This is redundant because it was already calculated in Step 1.

**Step 4:**

$t4 = t2 - t3$

The value of  $t3$  is subtracted from  $t2$ .

**2. Optimization Opportunity**

The expression:

$m * n$

appears twice:

$t1 = m * n$

$t3 = m * n$

This is a **common subexpression**.

We can reuse  $t1$ :

$t1 = m * n$

$t2 = p + q$

$t3 = t1$

$t4 = t2 - t3$

Or, because  $t3$  is only used once:

$t1 = m * n$

$t2 = p + q$

$t4 = t2 - t1$

**3. Benefits of Optimization**

Optimization:

- Eliminates repeated multiplication.
- Reduces the number of instructions.
- Reduces CPU operations.
- Improves execution speed.
- Can reduce temporary storage requirements.

Thus, **common subexpression elimination** improves the efficiency of intermediate code by reusing previously calculated results.

**Q4. Control Flow and Boolean Expression Handling**

Boolean expression:

if ( $x > y \parallel p < q$ )

Intermediate code:

if  $x > y$  goto L1

if  $p < q$  goto L1

goto L2

L1: ...

**1. Control Flow**

The first condition is checked:

if  $x > y$  goto L1

If:

$x > y = \text{TRUE}$

the control immediately jumps to L1.

Therefore,  $p < q$  does **not** need to be checked.

If:

$x > y = \text{FALSE}$

execution continues to:

if  $p < q$  goto L1

If  $p < q$  is true, execution goes to L1.

If both conditions are false:

goto L2

So the control flow is:

## 2. Short-Circuit Evaluation

The OR ( $\parallel$ ) operator uses short-circuit evaluation.

For:

$A \parallel B$

if A is true, the complete expression is already true, so B is not evaluated.

Here:

$x > y \parallel p < q$

If  $x > y$  is true, the compiler immediately jumps to L1.

This:

- Avoids unnecessary condition checking.
- Reduces execution time.
- Can prevent evaluation of expensive expressions.
- Produces efficient control-flow code.

Therefore, short-circuit evaluation improves the **performance of Boolean expression execution**.

---

## Q5. Backpatching and Flow Control

Given:

| Instruction | Target |
|-------------|--------|
|-------------|--------|

|                       |     |
|-----------------------|-----|
| 200: if $x == y$ goto | _ _ |
|-----------------------|-----|

|           |     |
|-----------|-----|
| 201: goto | _ _ |
|-----------|-----|

Backpatch lists:

truelist = {200}

falselist = {201}

### 1. Role of Backpatching

**Backpatching** is a technique used by the compiler to temporarily leave jump targets blank and fill them when the correct target address becomes known.

Initially:

|                       |   |
|-----------------------|---|
| 200: if $x == y$ goto | _ |
|-----------------------|---|

|           |   |
|-----------|---|
| 201: goto | _ |
|-----------|---|

The compiler does not yet know where the true and false branches should go.

The lists record the incomplete instructions:

truelist = {200}

falselist = {201}

## 2. Updating the True Target

Suppose the true branch begins at instruction 205.

The compiler backpatches instruction 200:

200: if x == y goto 205

So:

truelist = {200}

is updated with target 205.

## 3. Updating the False Target

Suppose the false branch begins at instruction 210.

Instruction 201 is updated:

201: goto 210

Therefore:

falselist = {201}

is backpatched with target 210.

## 4. Final Intermediate Code

200: if x == y goto 205

201: goto 210

205: ... TRUE block ...

...

209: goto 215

210: ... FALSE block ...

...

215: ... NEXT statement ...

## 5. Importance of Backpatching

Backpatching is important because the compiler may generate jump instructions **before the final target addresses are known**.

It is particularly useful for:

- Boolean expressions
- if-else statements
- while loops
- for loops
- Conditional jumps
- Complex control-flow structures

Thus, backpatching provides an efficient way to generate and complete **control-flow information during intermediate code generation**.

## RUBRICS FOR CALCULATION

| Criteria | Weightage | Level 4<br>(Exemplary) | Level 3<br>(Proficient) | Level 2<br>(Developing) | Level 1<br>(Beginning) |
|----------|-----------|------------------------|-------------------------|-------------------------|------------------------|
|----------|-----------|------------------------|-------------------------|-------------------------|------------------------|

|                         |     |                                                                                  |                                                      |                                          |                                               |
|-------------------------|-----|----------------------------------------------------------------------------------|------------------------------------------------------|------------------------------------------|-----------------------------------------------|
| Understanding of Data   | 25% | Accurately interprets all data patterns, trends, and relationships               | Interprets data correctly with minor gaps            | Partial understanding; misses key trends | Misinterprets or fails to understand data     |
| Analysis                | 25% | Provides deep analysis with strong logical reasoning and justification           | Provides reasonable analysis with some justification | Basic analysis with weak reasoning       | No meaningful analysis provided               |
| Application of Concepts | 20% | Effectively applies relevant concepts/tools to interpret data accurately         | Applies concepts with minor errors                   | Limited application; requires guidance   | Unable to apply concepts to data              |
| Conclusion              | 20% | Draws clear, meaningful conclusions with strong insights and implications        | Provides valid conclusions with moderate insights    | Conclusions are vague or weak            | No clear or valid conclusions                 |
| Clarity                 | 10% | Presents interpretation clearly using proper structure, visuals, and terminology | Generally clear with minor issues                    | Lacks clarity or proper structure        | Poor presentation and difficult to understand |
